[DynamicNLPModels.DenseLQDynamicBlocks](#) – Type.

Struct containing block A and B matrices used in creating the `DenseLQDynamicModel`. These matrices are given by Jerez, Kerrigan, and Constantinides in section 4 of "A sparse and condensed QP formulation for predictive control of LTI systems" (doi:10.1016/j.automatica.2012.03.010).

A is a $ns(N+1) \times ns$ matrix and B is a $ns(N) \times nu$ matrix containing the first column of the B block matrix in the above text. Note that the first block of zeros is omitted.

[DynamicNLPModels.DenseLQDynamicModel](#) – Method.

```
DenseLQDynamicModel(dnlp::LQDynamicData; implicit = false)    -> DenseLQDynamicModel  
DenseLQDynamicModel(s0, A, B, Q, R, N; implicit = false ...) -> DenseLQDynamicModel
```

A constructor for building a `DenseLQDynamicModel` <: `QuadraticModels.AbstractQuadraticModel`

Input data is for the problem of the form

$$\text{minimize } \frac{1}{2} \sum_{i=0}^{N-1} (s_i^T Q s_i + 2u_i^T S^T x_i + u_i^T R u_i) + \frac{1}{2} s_N^T Q f s_N \text{ subject to } s_{i+1} = A s_i + B u_i \text{ for } i = 0, 1, \dots, N-1, u_i = K s_i$$

Data is converted to the form

$$\text{minimize } \frac{1}{2} u^T H u + h^T u + h_0 \text{ subject to } Jz \leq g, u \leq u$$

Resulting H, J, h, and h0 matrices are stored within `QuadraticModels.QPData` as H, A, c, and c0 attributes respectively

If K is defined, then u variables are replaced by v variables. The bounds on u are transformed into algebraic constraints, and u can be queried by `get_u` and `get_s` within `DynamicNLPModels.jl`

Keyword argument `implicit = false` determines how the Jacobian is stored within the `QPData`. If `implicit = false`, the full, dense Jacobian matrix is stored. If `implicit = true`, only the first nu columns of the Jacobian are stored with the Linear Operator `LQJacobianOperator`.

```
SparseLQDynamicModel(dnlp::LQDynamicData)    -> SparseLQDynamicModel
SparseLQDynamicModel(s0, A, B, Q, R, N; ...) -> SparseLQDynamicModel
```

A constructor for building a `SparseLQDynamicModel` <: `QuadraticModels.AbstractQuadraticModel` Input data is for the problem of the form

$$\text{minimize } \frac{1}{2} \sum_{i=0}^{N-1} (s_i^T Q s_i + 2u_i^T S^T x_i + u_i^T R u_i) + \frac{1}{2} s_N^T Q f s_N \text{ subject to } s_{i+1} = A s_i + B u_i \text{ for } i = 0, 1, \dots, N-1, u_i = K s_i$$

Data is converted to the form

$$\text{minimize } \frac{1}{2} z^T H z \text{ subject to } l \leq J z \leq u \text{ con } l \leq z \leq u$$

Resulting H and J matrices are stored as `QuadraticModels.QPData` within the `SparseLQDynamicModel` struct and variable and constraint limits are stored within `NLPModels.NLPModelMeta`

If K is defined, then u variables are replaced by v variables, and u can be queried by `get_u` and `get_s` within `DynamicNLPModels.jl`

↪ 1))
```

set the data needed to build a `SparseArrays.SparseMatrixCSC` matrix. `H_colptr`, `H_rowval`, and `H_nzval` are set so that they can be passed to `SparseMatrixCSC()` to obtain the H matrix such that $z^T H z = \sum_{i=1}^{N-1} s_i^T Q s_i + \sum_{i=1}^{N-1} u_i^T R u_i + s_N^T Q f s_N$.
