DynamicNLPModels.DenseLQDynamicBlocks - Type.

Struct containing block A and B matrices used in creating the DenseLQDynamicModel. These matrices are given by Jerez, Kerrigan, and Constantinides in section 4 of "A sparse and condensed QP formulation for predictive control of LTI systems" (doi:10.1016/j.automatica.2012.03.010).

A is a  $ns(N+1) \times ns$  matrix and B is a  $ns(N) \times nu$  matrix containing the first column of the B block matrix in the above text. Note that the first block of zeros is omitted.

Data is converted to the form

$$minimize \frac{1}{2}u^THu + h^Tu + h0subject to Jz \leq gul \leq u \leq uu$$

Resulting H, J, h, and h0 matrices are stored within QuadraticModels.QPData as H, A, c, and c0 attributes respectively

If K is defined, then u variables are replaced by v variables. The bounds on u are transformed into algebraic constraints, and u can be queried by get\_u and get\_s within DynamicNLPModels.jl

Keyword argument implicit = false determines how the Jacobian is stored within the QPData. If implicit = false, the full, dense Jacobian matrix is stored. If implicit = true, only the first nu columns of the Jacobian are stored with the Linear Operator LQJacobianOperator.
